--	--	--	---	--	--

- Can be thought of as link prediction in the affiliation network.
- Can we exploit auxiliary networks (like the friendship network)?

Modeling user-affiliation affinity

The combined network \mathcal{C}

The combined network \mathcal{C}

The combined network \mathcal{C}

$$\mathbf{C}(\lambda, \mathbf{D}) = \begin{bmatrix} \lambda \mathbf{S} & \mathbf{A} \\ \mathbf{A}^T & \mathbf{D} \end{bmatrix}$$

The combined network \mathcal{C}

$$\mathbf{C}(\lambda, \mathbf{D}) = \begin{bmatrix} \lambda \mathbf{S} & \mathbf{A} \\ \mathbf{A}^T & \mathbf{D} \end{bmatrix}$$

- \mathbf{S} : User-User adjacency.

The combined network \mathcal{C}

$$\mathbf{C}(\lambda, \mathbf{D}) = \begin{bmatrix} \lambda \mathbf{S} & \mathbf{A} \\ \mathbf{A}^T & \mathbf{D} \end{bmatrix}$$

- \mathbf{S} : User-User adjacency.
- \mathbf{A} : User-Affiliation adjacency.

The combined network \mathcal{C}

$$\mathbf{C}(\lambda, \mathbf{D}) = \begin{bmatrix} \lambda \mathbf{S} & \mathbf{A} \\ \mathbf{A}^T & \mathbf{D} \end{bmatrix}$$

- \mathbf{S} : User-User adjacency.
- \mathbf{A} : User-Affiliation adjacency.
- λ : relative weight associated with information in \mathbf{S} .

The combined network \mathcal{C}

$$\mathbf{C}(\lambda, \mathbf{D}) = \begin{bmatrix} \lambda \mathbf{S} & \mathbf{A} \\ \mathbf{A}^T & \mathbf{D} \end{bmatrix}$$

- \mathbf{S} : User-User adjacency.
- \mathbf{A} : User-Affiliation adjacency.
- λ : relative weight associated with information in \mathbf{S} .
- \mathbf{D} : unobserved (choices: $\mathbf{A}^T \mathbf{A}, \dots$).

Latent factors model

Modeling \mathcal{A} alone

Modeling \mathcal{A} alone

- User-group affinity as product of low dimensional vectors:
 $A_{i,j} \approx \langle \mathbf{U}(i, :), \mathbf{G}(i, :) \rangle.$

Modeling \mathcal{A} alone

- User-group affinity as product of low dimensional vectors:

$$A_{i,j} \approx \langle \mathbf{U}(i,:), \mathbf{G}(i,:) \rangle.$$

$$\mathbf{A} \approx \mathbf{U}\mathbf{G}^T$$

$$\text{rank}(\mathbf{U}) \leq k, \text{rank}(\mathbf{G}) \leq k$$

\mathbf{U} - User preferences; \mathbf{G} - Affiliation characteristics.

Modeling \mathcal{A} alone

- User-group affinity as product of low dimensional vectors:

$$A_{i,j} \approx \langle \mathbf{U}(i,:), \mathbf{G}(i,:) \rangle.$$

$$\mathbf{A} \approx \mathbf{U}\mathbf{G}^T$$

$$\text{rank}(\mathbf{U}) \leq k, \text{rank}(\mathbf{G}) \leq k$$

\mathbf{U} - User preferences; \mathbf{G} - Affiliation characteristics.

- For user u , recommend affiliations with high affinity.

Modeling \mathcal{C}

Modeling \mathcal{C}

- A **good model** will account for edges in \mathcal{S} too.

Modeling \mathcal{C}

- A **good model** will account for edges in S too.

$$\mathbf{C}(\lambda, \mathbf{D}) = \begin{bmatrix} \lambda^S & A \\ A^T & \mathbf{D} \end{bmatrix} \approx \begin{bmatrix} \mathbf{V}_1 \\ \mathbf{V}_2 \end{bmatrix} \Lambda \begin{bmatrix} \mathbf{V}_1^T & \mathbf{V}_2^T \end{bmatrix}$$

$$\text{rank}(\mathbf{V}_i) \leq k, \text{rank}(\Lambda) \leq k$$

Modeling \mathcal{C}

- A **good model** will account for edges in S too.

$$\mathbf{C}(\lambda, \mathbf{D}) = \begin{bmatrix} \lambda S & A \\ A^T & \mathbf{D} \end{bmatrix} \approx \begin{bmatrix} \mathbf{V}_1 \\ \mathbf{V}_2 \end{bmatrix} \Lambda \begin{bmatrix} \mathbf{V}_1^T & \mathbf{V}_2^T \end{bmatrix}$$

$$\text{rank}(\mathbf{V}_i) \leq k, \text{rank}(\Lambda) \leq k$$

- So $A \approx \mathbf{V}_1 \Lambda \mathbf{V}_2^T$.

Modeling \mathcal{C}

- A **good model** will account for edges in S too.

$$\mathbf{C}(\lambda, \mathbf{D}) = \begin{bmatrix} \lambda^S & A \\ A^T & \mathbf{D} \end{bmatrix} \approx \begin{bmatrix} \mathbf{V}_1 \\ \mathbf{V}_2 \end{bmatrix} \Lambda \begin{bmatrix} \mathbf{V}_1^T & \mathbf{V}_2^T \end{bmatrix}$$

$$\text{rank}(\mathbf{V}_i) \leq k, \text{rank}(\Lambda) \leq k$$

- So $A \approx \mathbf{V}_1 \Lambda \mathbf{V}_2^T$.
- $\mathbf{V}_1 \Lambda \mathbf{V}_2^T$ is a similarity score matrix for ranking potential affiliations.

Graph proximity model

Proximity between users in a social network

Proximity between users in a social network

Proximity between users in a social network

Proximity between users in a social network

Proximity between users in a social network

$(\mathbf{C}^2)_{i,j}$: Number of paths of length 2 between i and j .

Proximity between users in a social network

Proximity between users in a social network

Proximity between users in a social network

Proximity between users in a social network

Proximity between users in a social network

Proximity between users in a social network

$(\mathbf{C}^3)_{i,j}$: Number of paths of length 3 between i and j .

Graph Proximity Model

Graph Proximity Model

- $\text{Proximity}(i,j) = \beta^2(\mathbf{C}^2)_{i,j} + \beta^3(\mathbf{C}^3)_{i,j} + \dots$

Graph Proximity Model

- $\text{Proximity}(i, j) = \beta^2(\mathbf{C}^2)_{i,j} + \beta^3(\mathbf{C}^3)_{i,j} + \dots$
- Known as Katz measure, when the series is convergent, i.e. $\|\beta\mathbf{C}\|_2 < 1$.

Graph Proximity Model

- $\text{Proximity}(i, j) = \beta^2(\mathbf{C}^2)_{i,j} + \beta^3(\mathbf{C}^3)_{i,j} + \dots$
- Known as Katz measure, when the series is convergent, i.e. $\|\beta\mathbf{C}\|_2 < 1$.
- A practical and good approximation: Truncated Katz,

$$\text{tKatz}(\mathbf{C}, \beta, k) = \sum_{i=1}^k \beta^i \mathbf{C}^i.$$

Graph Proximity Model

- $\text{Proximity}(i, j) = \beta^2(\mathbf{C}^2)_{i,j} + \beta^3(\mathbf{C}^3)_{i,j} + \dots$
- Known as Katz measure, when the series is convergent, i.e. $\|\beta\mathbf{C}\|_2 < 1$.
- A practical and good approximation: Truncated Katz,

$$\text{tKatz}(\mathbf{C}, \beta, k) = \sum_{i=1}^k \beta^i \mathbf{C}^i.$$

- Recommend affiliations based on proximity in \mathbf{C} .

Scalability

Real world networks are huge!

Real world networks are huge!

- *Orkut* (sub)network [Mislove,2007] is about 3 million users and 8 million groups.

Real world networks are huge!

- *Orkut* (sub)network [Mislove,2007] is about 3 million users and 8 million groups.
- Recall $\text{tKatz}(\mathbf{C}, \beta, k) = \sum_{i=1}^k \beta^i \mathbf{C}^i$.

Real world networks are huge!

- *Orkut* (sub)network [Mislove,2007] is about 3 million users and 8 million groups.
- Recall $\text{tKatz}(\mathbf{C}, \beta, k) = \sum_{i=1}^k \beta^i \mathbf{C}^i$.
- \mathbf{C}^i gets denser — prohibitively expensive computations and memory usage.

So how does the model scale?

So how does the model scale?

- A plausible solution...

So how does the model scale?

- A plausible solution...
- Use low rank approximations — $\mathbf{C} \approx \mathbf{V}\mathbf{\Lambda}\mathbf{V}^T$.

So how does the model scale?

- A plausible solution...
- Use low rank approximations — $\mathbf{C} \approx \mathbf{V}\mathbf{\Lambda}\mathbf{V}^T$.
- Then, $\mathbf{C}^i \approx \mathbf{V}\mathbf{\Lambda}^i\mathbf{V}^T$. [Submitted]

Smarter solutions...

Smarter solutions...

- $\text{tKatz}(\mathbf{C}; \beta, 3)_{12} = \beta \mathbf{A} + \beta^2 \lambda \mathbf{S} \mathbf{A} + \beta^3 (\lambda^2 \mathbf{S}^2 \mathbf{A} + \mathbf{A} \mathbf{A}^T \mathbf{A}).$

Smarter solutions...

- $\text{tKatz}(\mathbf{C}; \beta, 3)_{12} = \beta \mathbf{A} + \beta^2 \lambda \mathbf{S} \mathbf{A} + \beta^3 (\lambda^2 \mathbf{S}^2 \mathbf{A} + \mathbf{A} \mathbf{A}^T \mathbf{A})$.
- $(\mathbf{A} \mathbf{A}^T)^i, \mathbf{S}^i, (\mathbf{A} \mathbf{A}^T)^j \mathbf{S}^i$ get denser.

Smarter solutions...

- $\text{tKatz}(\mathbf{C}; \beta, 3)_{12} = \beta \mathbf{A} + \beta^2 \lambda \mathbf{S} \mathbf{A} + \beta^3 (\lambda^2 \mathbf{S}^2 \mathbf{A} + \mathbf{A} \mathbf{A}^T \mathbf{A})$.
- $(\mathbf{A} \mathbf{A}^T)^i$, \mathbf{S}^i , $(\mathbf{A} \mathbf{A}^T)^j \mathbf{S}^i$ get denser.

$$\mathbf{A} = \mathbf{U}_A \Sigma_A \mathbf{V}_A^T$$

$$\mathbf{S} = \mathbf{U}_S \Sigma_S \mathbf{U}_S^T$$

Smarter solutions...

- $\text{tKatz}(\mathbf{C}; \beta, 3)_{12} = \beta \mathbf{A} + \beta^2 \lambda \mathbf{S} \mathbf{A} + \beta^3 (\lambda^2 \mathbf{S}^2 \mathbf{A} + \mathbf{A} \mathbf{A}^T \mathbf{A})$.
